## Seabirds and Sea Ducks of Labrador

Seabirds and sea ducks spend most of their lives at sea or in coastal waters. During summer, they come to land to breed and rear their young.

Birds are interesting to observe and important to Labrador culture.

Arctic Tern (Steam)

Turrs, razorbills, and puffins prey on small fish, such as capelin and lance, to feed their young. Seabirds are highly sensitive to changes in the marine environment. Climate change, shifts in ocean currents, disturbance, and ocean pollution may impact the survival of young.

White-winged Scoter (Diver)

Black Scoter (Copper, Butter, or Brass-nosed Diver)

Surf Scoter (Bottle-nosed Diver)

Scoters (divers) congregate in large numbers during migration. All photos, adult male.

- What You Can Do:**
- Teach youth about birds.
  - Report oil spills and harmful pollution.
  - Respect hunting guidelines and regulations.
  - Minimize disturbance where birds congregate.
